HOW TO EDIT LOGOS

Change the text, swap the background and export, in **Photoshop** or the free **Photopea** (photopea.com). No design skills needed.

5 styles
Badge, Gradient, Hexagon, Minimal and Neon. Each folder has a PSD template and 4 PNG examples.

1024×1024
Server Settings › Server Profile › Icon. Discord crops it into a circle, keep letters in the middle.

LAYERS IN A LOGO TEMPLATE

Initials (edit me)	text + shadow / glow
Ring / Hexagon / Frame / Dot	image
Background (replace me)	image

1 Install the fonts

Open **Fonts (install first)**, double-click each .ttf file and press **Install**. Both fonts are free under the SIL Open Font License.

2 Open the PSD

Photoshop: double-click the file. Photopea: drag the file into the browser tab. If Photoshop asks to update text layers, click **Update**.

3 Change the text

Pick the **Text tool (T)** and double-click the text on the canvas, or double-click the T icon of the layer. Type your own text.

4 Change the colors

Select the text layer and change the color in the Character panel. For the background, put a new color or gradient above **Background (replace me)**.

5 Export

Photoshop: **File › Export › Export As › PNG**. Photopea: **File › Export as › PNG**. Keep the same size.

Shadows update by themselves. Title shadows are live layer effects (fx). Double-click **Drop Shadow** under the layer to change or turn it off.

Best with 1 to 3 letters. Longer text gets too small to read in the server list. The text is centered, so it stays in the middle when you type fewer or more letters.
